

Axis Security App Access Cloud.

Simple, secure, managed, private application access

Opportunity Unlocked.

To stay competitive, businesses must leverage partners, third parties, and employees wherever they work. Yet complex networks, legacy VPN's, vulnerable applications, and evolving cyber threats make enabling private application access a slow, complex, and risky operation.

Not anymore. Axis Security enables any organization to deliver secure, tightly managed private application access to virtually anyone, anywhere, on any device in minutes, with no network changes no client software, in minutes.

Application access is brokered through the App Access Cloud™, a scalable purpose-built, zero trust security platform that isolates applications and vigilantly monitors user requests, eliminating network-level complexity and application exposure. Application Isolation and Adaptive Access technologies cloak applications from Internet threats, eliminate attack surfaces, and continuously enforce granular IT policy.

With Axis, partners are quickly enabled and business is accelerated while significantly improving application security.

Fast, Simple and Secure Deployment in Minutes

- Deploys in minutes with no network changes
- Cloud-centric, no software clients or hardware to configure
- Application Isolation and Adaptive Access Technologies secure apps and enterprise

Easy Application Access Anywhere

- Any device, any browser
- Any location
- Familiar and transparent user experience

Continuous Monitoring, Analysis, and Policy-Driven Operations

- Context-rich cross-application policies by time, location, device, user, and more
- Application-level feature blocking and session recording
- Portfolio-wide visibility, reporting, and management

The Axis Management Console delivers IT a clear view of user activity across the entire organization's application portfolio.

How Axis Works:

Quick Deployment

Axis deploys in minutes with a no-configuration software Connector that isolates the application and securely relays user requests and application responses to the Axis App Access Cloud™ for analysis. No network changes or client software are required.

Easy User Access

Users interact with Axis managed applications from anywhere on any device; No agents or training required. Requests are brokered through App Access Cloud™ keeping the local network, application and data isolated.

Centralized Management and Continuous Policy Control

The Axis Management Console gives IT a real-time view of user activity across all applications, enhanced by Smart Tags™ that highlight important events. The console enables IT to create cross-application policies that limit access, suppress features, trigger session recording and more.

The Practical Path to a Zero Trust Business.

Axis empowers a business to quickly enable partners, accelerate mergers, and improve remote worker productivity, quietly transforming vulnerable applications into centrally managed zero trust resources. With Axis, this zero trust posture is incremental, easy, and business driven.

We're looking to advance our security into a zero trust model -and an important part of zero trust is a secure access solution like Axis Security... with Axis we are adapting the cloud and zero trust without anyone knowing it."

CISO, Global Hospitality Chain
